IIT JODHPUR

INSPIRATION

Digital tools, devices and advanced technologies have taken over the major manual tasks but even today manual grading all the answer sheets could be quite tedious and tiresome.

With the evolving automation, we have chosen to tackle this problem of grading answer sheets automatically in our design project.

PROBLEM STATEMENT

Having a handwritten answer sheet, with each answer, a problem solution is required to evaluate or grade the respective answer sheet by providing a score value to that answer sheet, depending upon a certain specified criterion.

OBJECTIVE

Automatic answer grader aims at presenting an automatic grading solution that could perform handwriting recognition and extraction of texts from handwritten answer sheets and furthermore could grade those sheets (evaluated by providing a score) by providing a score value, upon a certain specified criterion.

APPROACHES

1. Character by character approach
2. Line by line approach

CHARACTER BY CHARACTER

1. Extracting words from answer sheets
2. Extracting characters from words
3. Handwritten Character recognition
4. Evaluation

AUGMENTED DATASET

BEFORE AUGMENTATION : 520 (total)

AFTER AUGMENTATION : 1560 (total)

1. dynamic programming

2. fork

3. threads

4. Compiler

ANSWER SHEET

fork

Compiler

**EXTRACTED
WORDS**

EXTRACTED CHARACTERS

```
['dataset/C']  
['dataset/O']  
['dataset/R']  
['dataset/P']  
['dataset/I']  
['dataset/C']  
['dataset/E']  
['dataset/R']
```

CHARACTER RECOGNITION

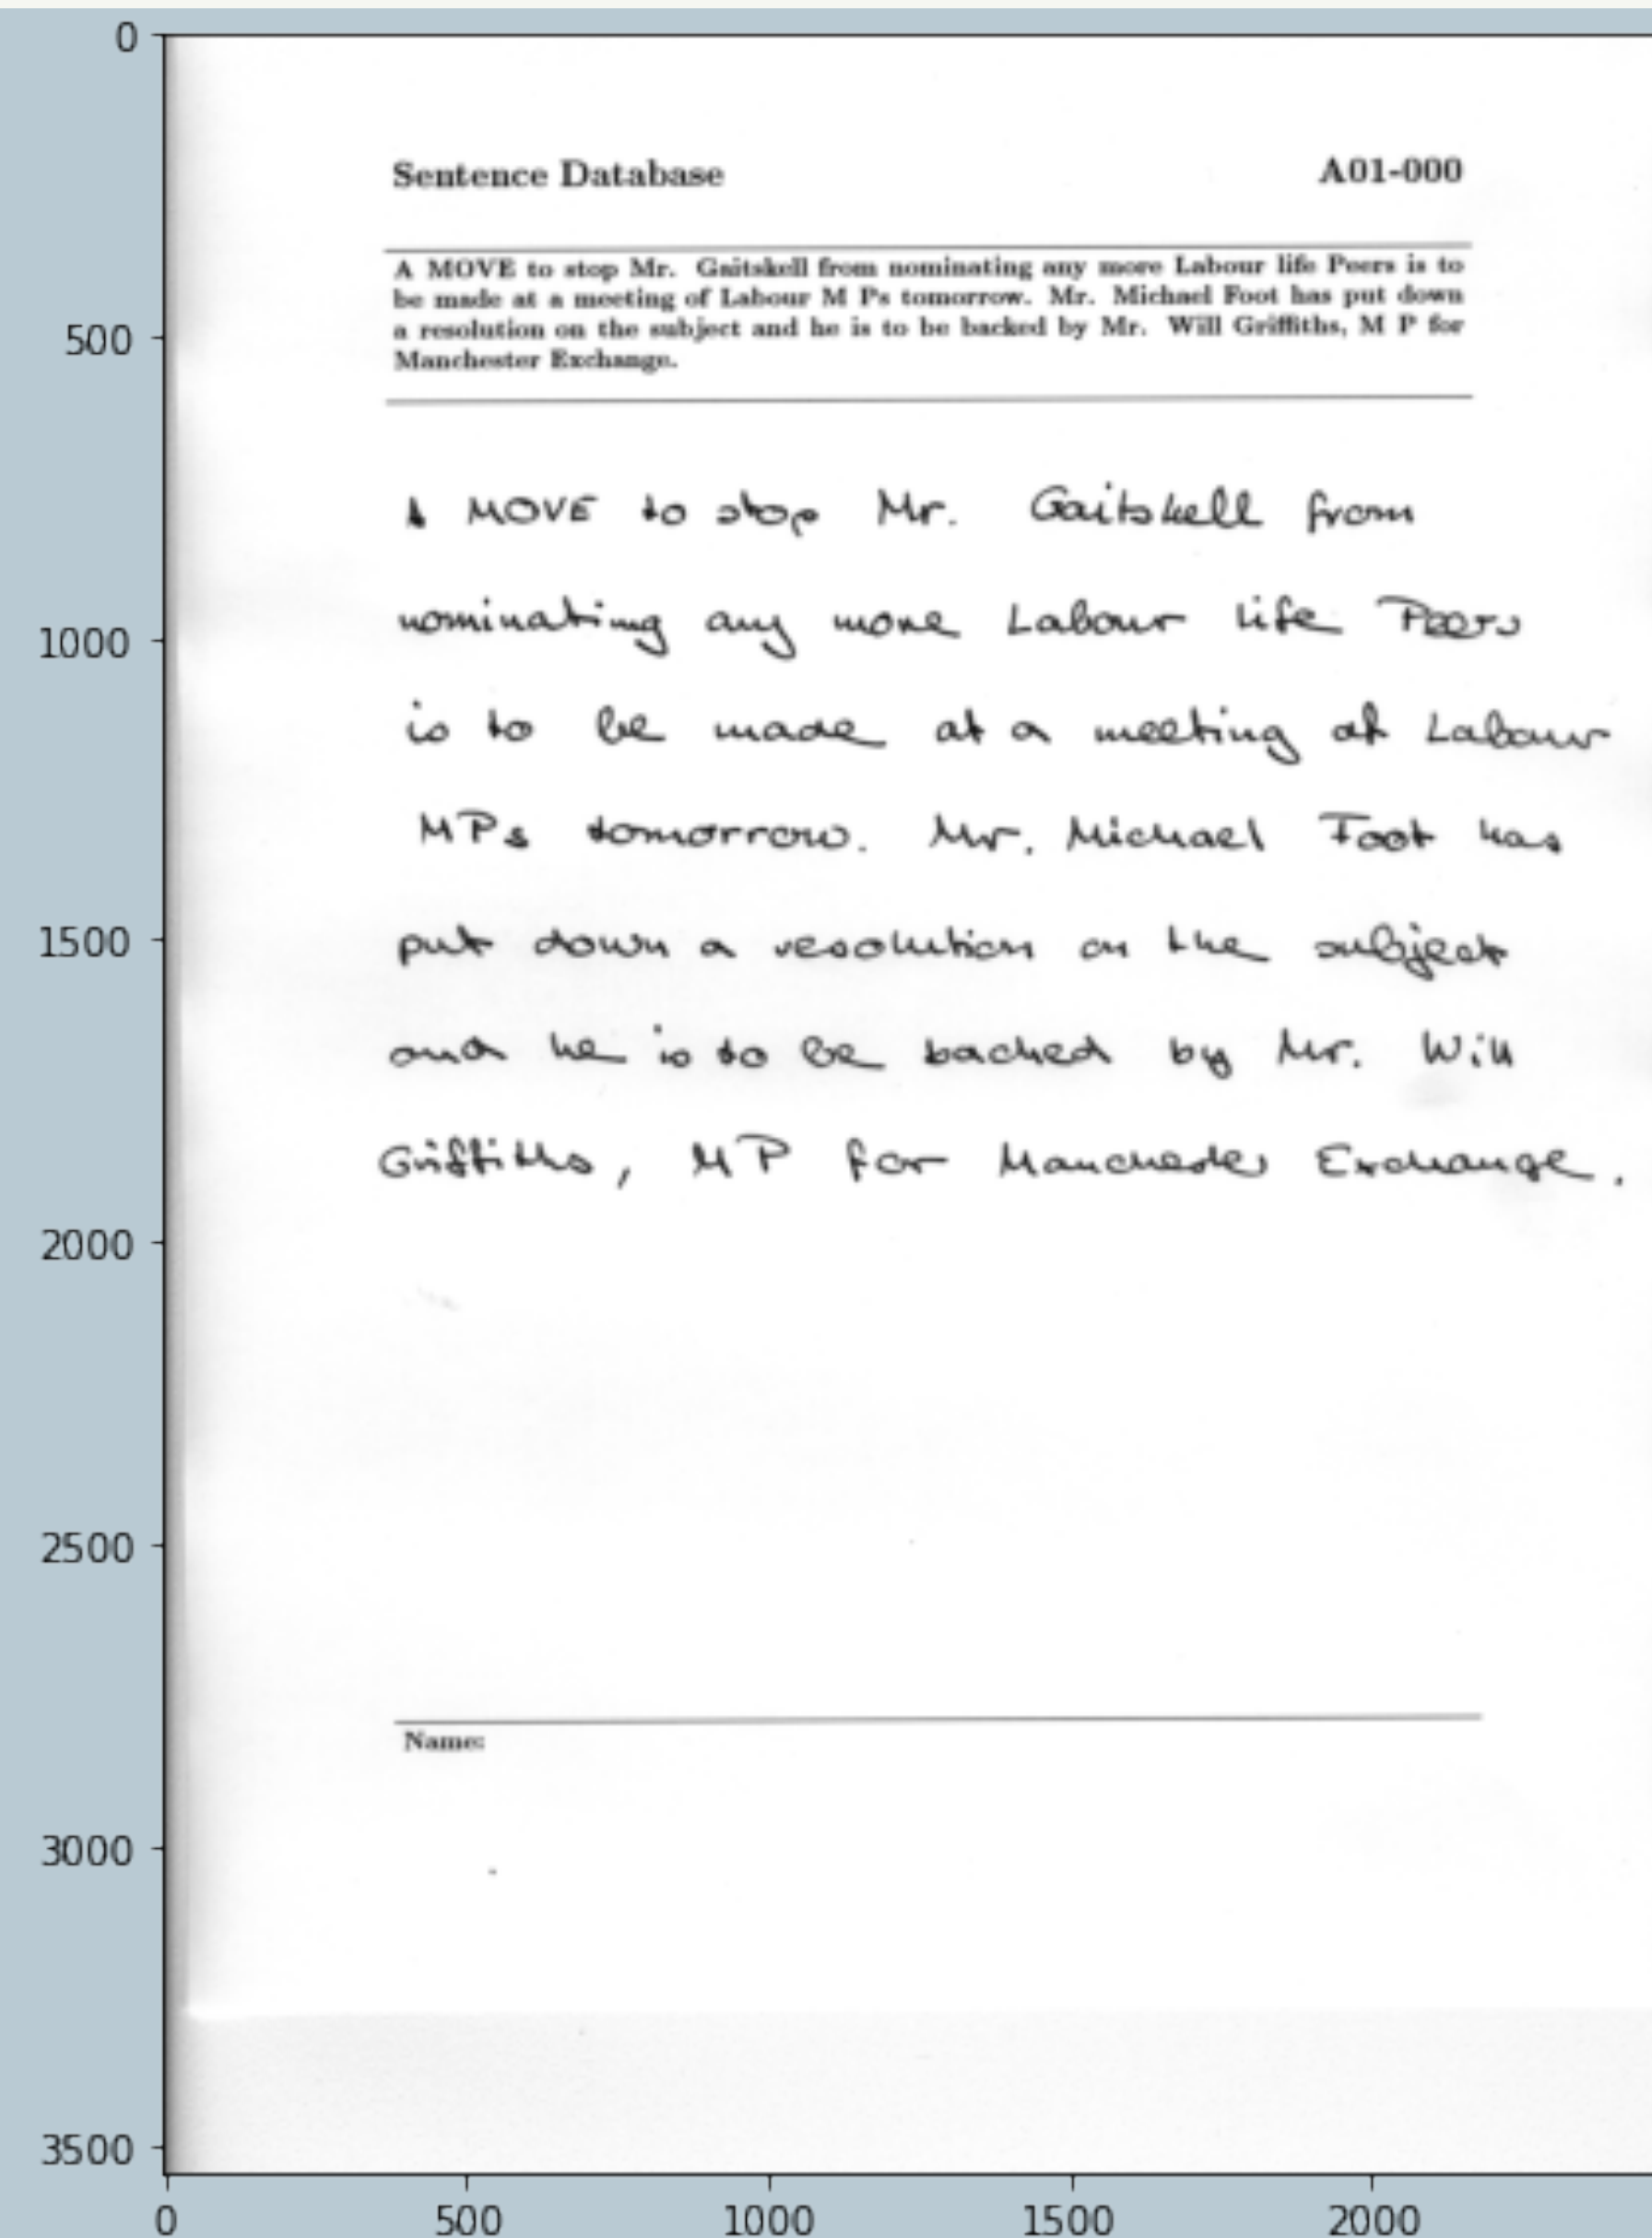

USING MOBILE NET

LINE BY LINE

1. Image Processing
2. Words Recognition
3. Grading/Evaluation

DATASET SAMPLE

(*IAM DATASET*)

DATA COUNT

TOTAL IMAGES : 1539 Pages

TOTAL WORDS : 115320 Words

ANSWER SHEET

Name :

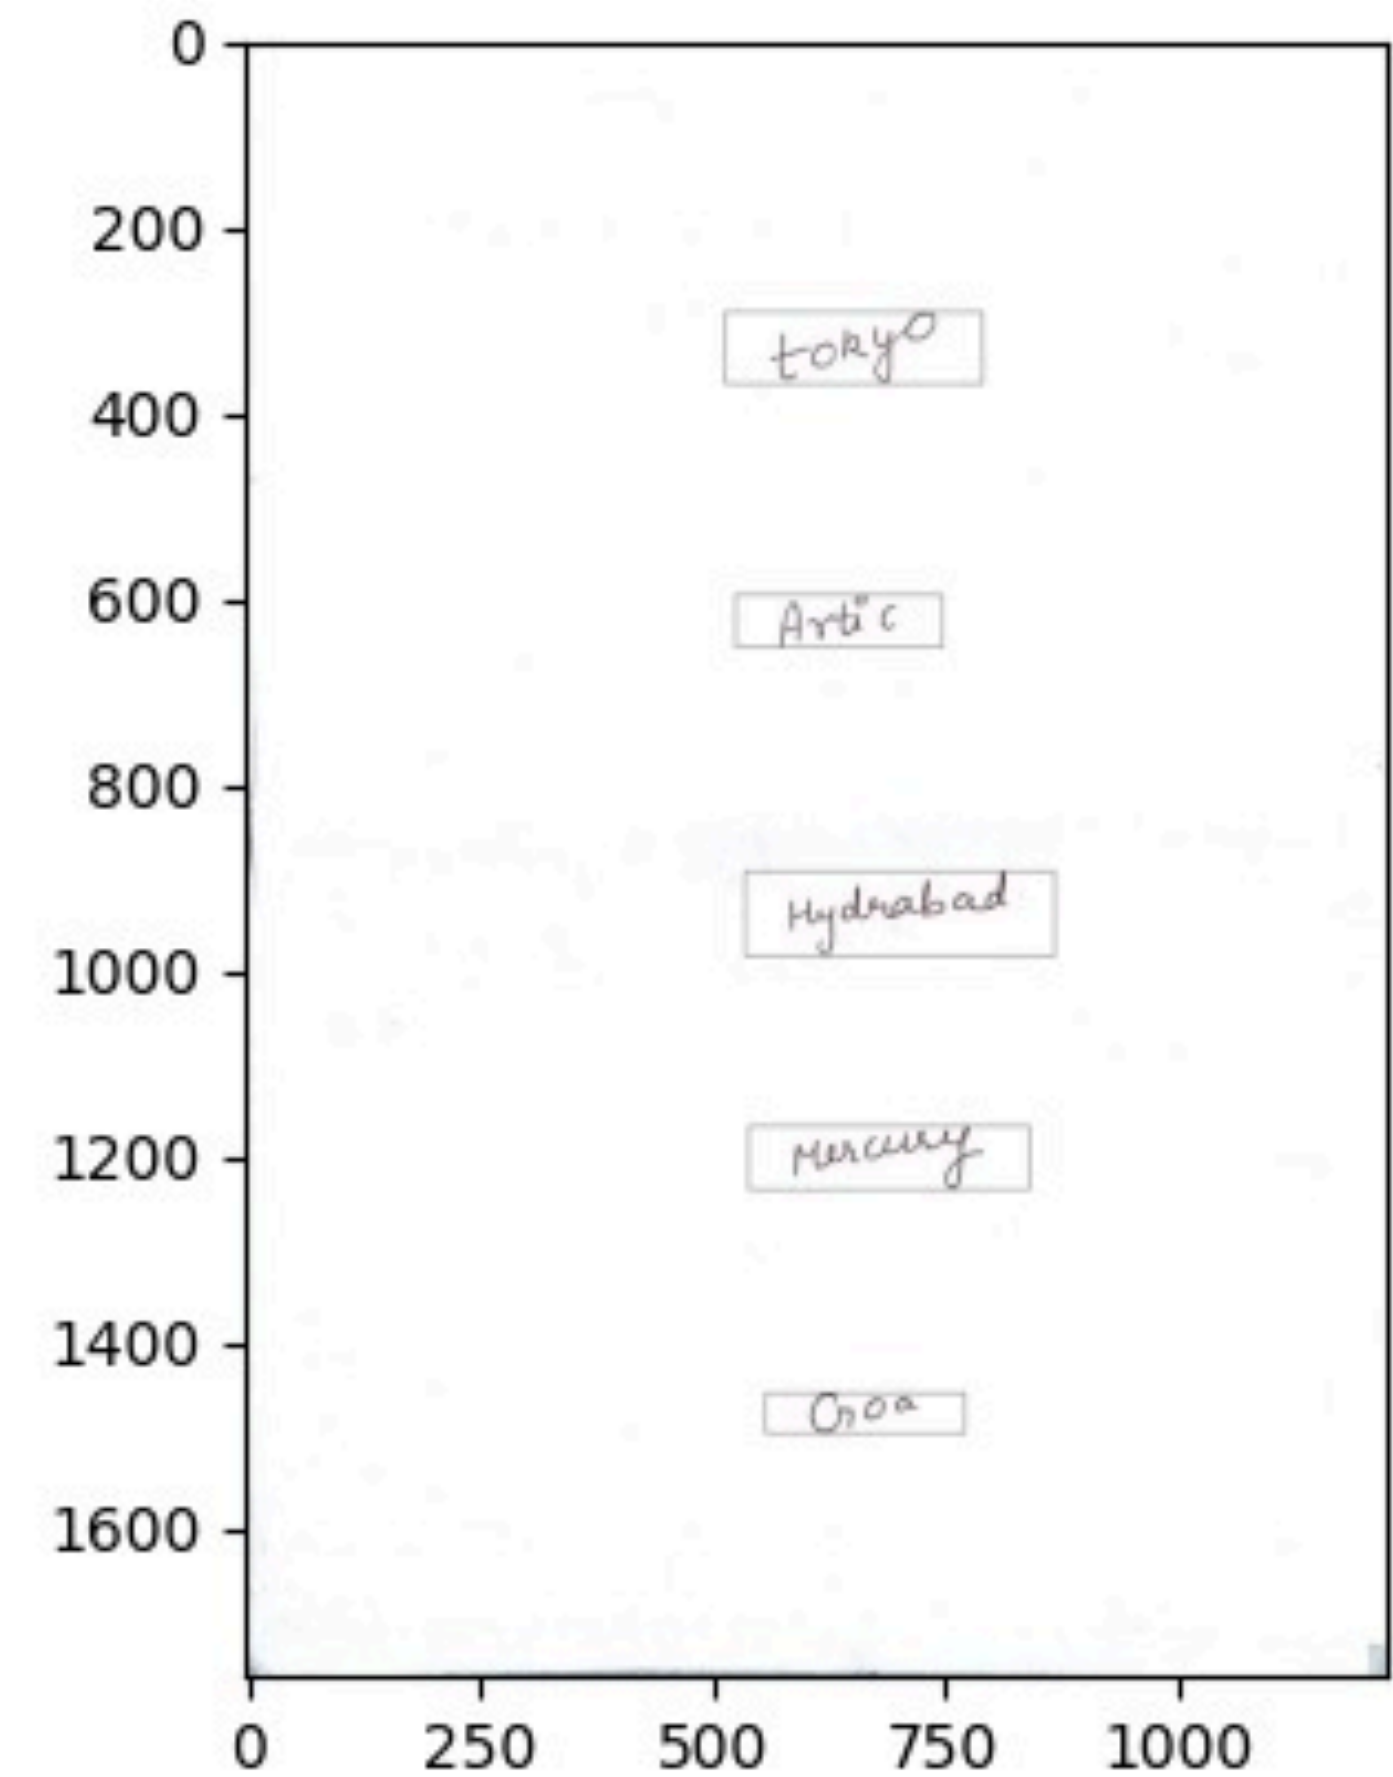

Set : 1

1. Tokyo
2. atlantic
3. hyderabad
4. neptune
5. Sikkim

IMAGE PROCESSING

1. Grayscale image
2. Gaussian blur for noise reduction
3. Rectangular shaped kernel
4. Image Dilation
5. Find Contours
6. Filter required contours
7. Draw rectangles around words

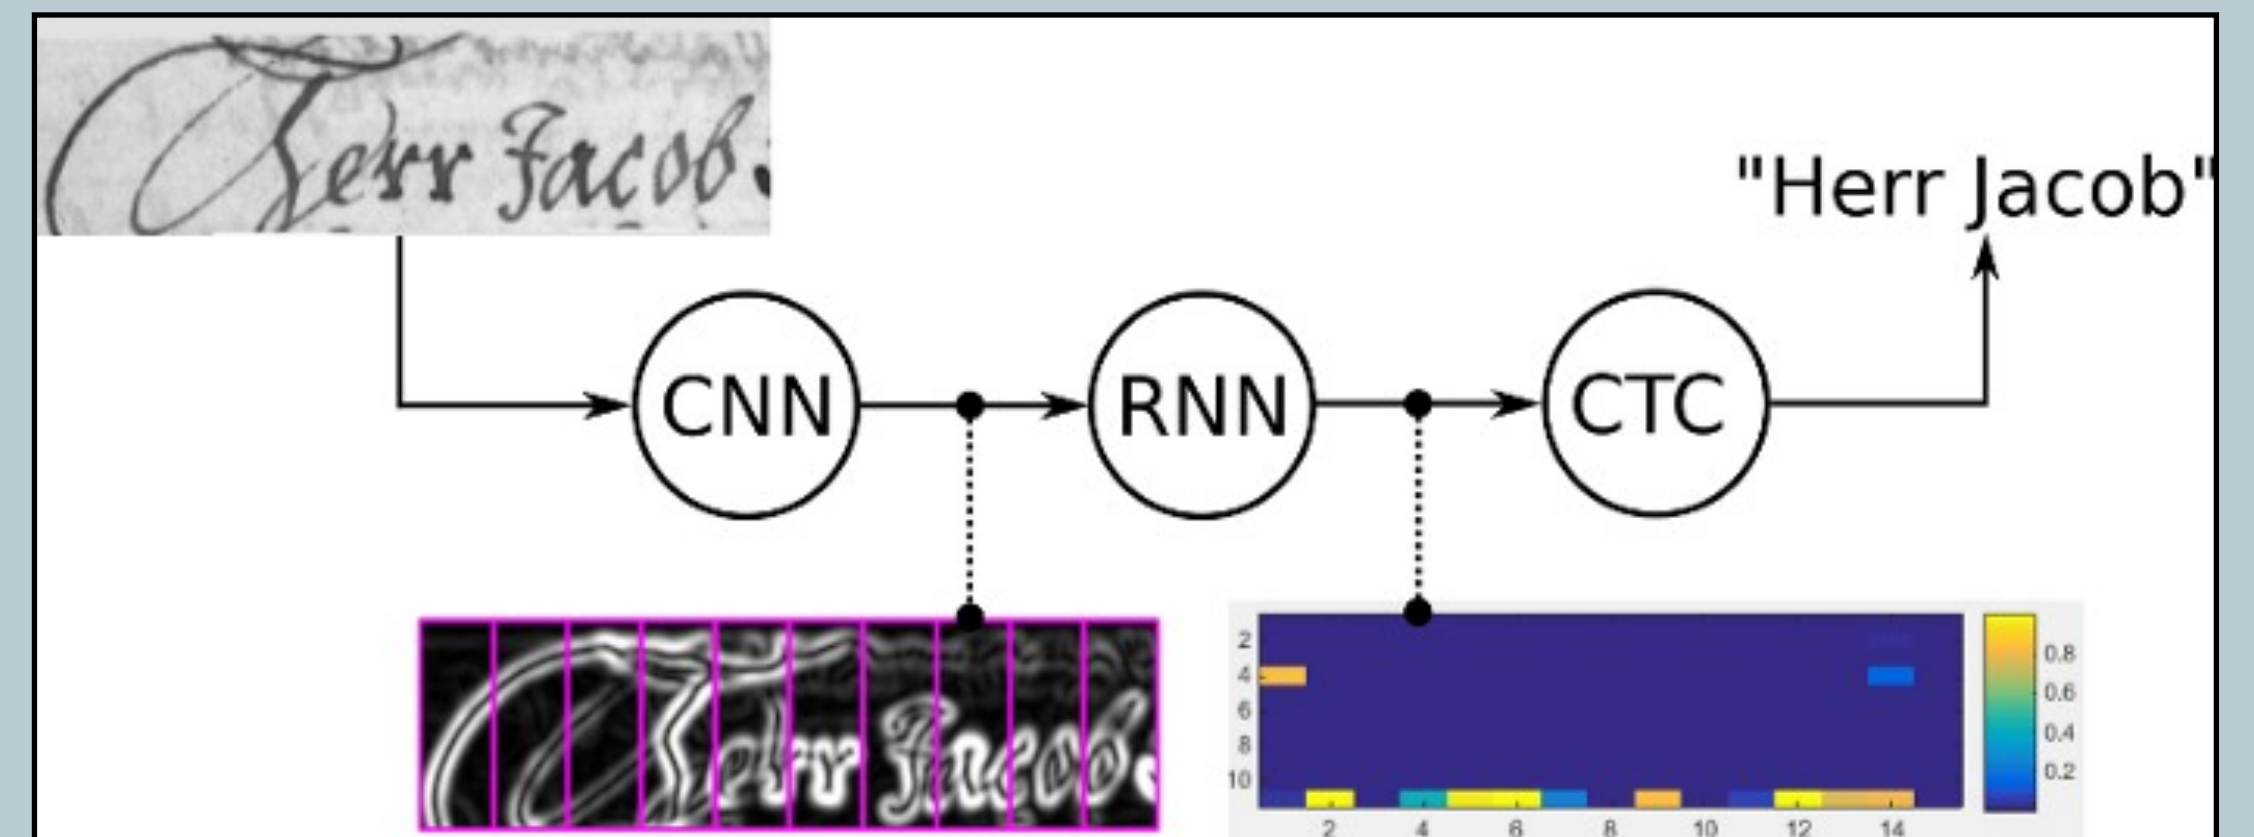

PROCESSED IMAGE

EXTRACTED WORDS

WORD RECOGNITION

SOURCE : [Towardsdatascience](#)

CNN

1. Input Image is fed to CNN
2. Relevant features extraction
3. 5 layers are used
 1. Convolution operation
 2. Last layer to input
4. RELU function is applied
5. Feature Map

RNN

1. LSTM is used as it is able to propagate information through longer distance
2. Output matrix is passed to the CTC

CTC

1. Loss value is calculated using RNN output matrix and ground truth
2. While inferring, CTC decodes matrix into final text

EVALUATION

1. Setting a threshold value
2. Finding Edit Distance
3. If $\text{threshold} * \text{correctAnswerLength}$ is greater than equal to EditDistance
 1. Grade Correct
4. Else Grade Incorrect

RESULTS

```
2 1 00a goa
4 3 pescy mercury
1 2 tokys tokyo
3 3 tydnabad hyderabad
0 2 arttic artic
Score : 3/5
```

```
1 1 gou goa

4 2 atlantic artic
Score : 2/5
```

GRADING ACCURACY

1. 60 % of the answer sheets have been graded correctly
2. 30 % are having minute errors
3. 10 % missed an answer

SCOPE FOR IMPROVEMENT

1. Working on cursive handwriting
 1. Deslanting Algorithm
2. Multiple word answer evaluation
 1. Increasing input size of neural network
3. Improved strategy for grading
4. Improved accuracy for model
 1. Add more CNN layers

GITHUB REPOSITORY

<https://github.com/nehasoni16/Automatic-Answer-Grader.git>

CONCLUSION

An Automatic answer grading model has been proposed and implemented for perform handwriting recognition and extraction of texts from handwritten answer sheets and furthermore grading of those sheets (evaluated by providing a score) by proving a score value, upon a certain specified criterion for evaluation.
